

Two-Column Operations Memo

Document ID: K11-COLUMN-ORDER

This memo tests whether a document conversion model preserves the visual reading order of a two-column document when the PDF content stream draws the right column first.

Main Memo

- S1: Intake starts when the west dock opens at 06:40 and the control desk records batch code OAK-17.
- S2: Validation must compare the OAK-17 manifest against checksum 4F9C before any bins move to staging.
- S3: Staging assigns Lane B to refrigerated cartons and Lane D to dry cartons; do not swap the lane labels.
- S4: Supervisor Mira signs the staging slip only after both lane counts match the manifest.

- S5: Packing begins after the staging slip is signed and uses seal group SG-42 for the refrigerated cartons.
- S6: Quality review samples two cartons from Lane B and one carton from Lane D before release.
- S7: Release notification goes to North Relay at 08:35 with subject line "OAK-17 ready".
- S8: Archive the signed slip, checksum report, and release notification under folder RUN-2026-07.

Sidebar

Risk flags: do not confuse OAK-17 with OAK-71; do not use seal group SG-24; do not release before 08:35.

Footnote

Column order is part of the document record.
